

Fixed-depth tilt response: actual pose and depth loss
3 completed / 3 planned conditions; 3 valid full reference protocols

Actual tilt is measured at the reference endpoint. Depth loss = depth before tilt window – terminal depth; negative means deeper. No material-deformation claim.

Masks: — pending; RUN incomplete; EX excluded; NV numerical reject; GP grasp failure; BD budget; DG depth gate; TI tilt sequence; RC recovery incomplete/censored; NA missing; N/A unplanned.

One run per condition. Differences are descriptive; no statistical significance or physical-world validation is implied.
